Data Rescue PC³

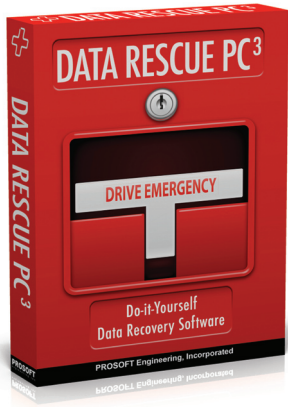

Do-it-Yourself Data Recovery Software

Why do I need Data Rescue PC³?

- If your hard drive won't mount.
- If your hard drive is corrupt due to viruses, errors or operating system failure and you can't access files from it.
- If you need to recover deleted files.

Data Rescue PC³ is a data recovery utility used for recovering files from crashed or virus corrupted hard drives. In fact, we market Data Rescue PC³ as a "Hard Drive Recovery Service in a box!" because many data recovery services actually use Data Rescue PC.

Data Rescue PC³ is not a repair utility like Easy Recovery™ from Ontrack or Fix-It™ from VCOM. The danger in using a repair utility is that you stand the chance of overwriting files during the repair process, meaning you can lose data. Data Rescue PC³ will NOT write to the drive it's scanning; therefore, never puts your data in harm's way. This is why so many data recovery service shops have come to rely on the power of Data Rescue PC³ to offer their customers data recovery services.

The key feature that sets Data Rescue PC³ apart from the slew of other data recovery programs is the bootable CD. Because Data Rescue PC³ comes on a bootable CD, it works in more cases than traditional Windows-based recovery tools which require your computer to be running Windows in order to install and run the application. This is very helpful in situations where you have a virus corrupted or crashed hard drive that you are unable to install additional software on; with Data Rescue PC³ you can boot right from the CD. Simply insert the CD and reboot your computer. You will then be greeted by the user-friendly interface that will guide you through the whole recovery process. Once the scan has been completed, it will show you all the partitions and files that were found on the drive. Files will be listed in their original order and filenames, and they will be rated in four levels: excellent, good, fair, and poor to help you pick and choose which files to recover.

Data Rescue PC³ is a forensic tool, so it digs deep for data. We have had several customers tell us that the amount of data it has recovered is haunting. Files that had been deleted eons ago, as well as current data, are easily found.

Below are some of the other powerful features available in Data Rescue PC³ that will help you get those files back:

- Raw Scan Recovery: Detects a variety of popular file types even after deletion
- Cloning: If you have a drive that is about to physically fail, you can quickly clone the data to another drive and use Data Rescue PC to scan the clone.
- Network support: No secondary drive to recover to? You can save directly to a network drive.

Please note that you will need an external USB* or FireWire* hard drive, secondary internal hard drive*, or network drive to recover your data to. Once again, this is because Data Rescue PC will NOT write to your bad drive (which can cause more problems or even worse, the loss of your files).

*Formatted FAT32
